

Joel Rhine

SENIOR FULL STACK DEVELOPER

joelrhine@protonmail.com · 1(805)636-6997 · Columbia, TN
linkedin.com/in/joel-t-rhine · github.com/rhon3n

PROFESSIONAL SUMMARY

Full stack software engineer with 6+ years of professional experience building and operating production software with TypeScript, React, Next.js, Node.js, and PostgreSQL. Strong fit for product work that spans technical design, UI development, application logic, data modeling, release ownership, and production support. Recent work includes AI-assisted development workflows, AI-enabled product features, automated testing, code review, and shipping software in close partnership with business stakeholders under ambiguity.

CORE SKILLS

Languages and frameworks: TypeScript, JavaScript, React, Next.js, Node.js, Python, SQL, Tailwind CSS

Backend and data: PostgreSQL, Supabase, relational schema design, REST APIs, webhooks, ETL pipelines, analytics instrumentation

AI-assisted development: Codex, Claude Code, RAG, structured outputs, prompt iteration, AI-assisted testing, debugging, refactoring, documentation review

Architecture and delivery: full stack system design, technical scoping, build-to-run ownership, CI/CD, release process, production maintenance, code reviews

Platforms and tools: GitHub, Vercel, Supabase, BigQuery, GCP, Terraform, Periscope Data, Apache Airflow

PROFESSIONAL EXPERIENCE

Founding Engineer | measure.coffee | March 2026 to current

- Architected and built a production coffee improvement application with Next.js, React, TypeScript, Node.js, Supabase, and PostgreSQL, covering UI, API routes, authentication, billing, deployment, and ongoing maintenance
- Designed relational data models and access patterns for user profiles, equipment, recipes, catalogs, and AI conversation history
- Built AI-enabled product features, including the Measure Agent Terminal, a chat interface that brings together product tools, recipe logs, and user context in one workspace
- Used Codex and Claude Code in day-to-day development for coding, debugging, refactoring, test generation, and iterative design while maintaining review discipline and engineering standards
- Developed automated regression coverage across API routes, database migrations, agent behavior, public preview flows, security controls, and React components
- Owned delivery from concept through run, including release process, staged merges, deployment checks, and production issue follow-through

Software Engineer, Automations Team | ZeroClick | 2024 to March 2026

- Built a Claude Code powered RAG workflow over internal tools and adblock scripts, reducing broken adblock repair time in complex cases from days to hours
- Built the auto-detect pipeline for an auto-coupon browser extension, classifying retailer page types at runtime and triggering the right API automations
- Designed event schemas and experiments with analytics partners to measure checkout and offer behavior in production
- Improved debugging paths and production visibility across recurring partner, extension, and event-driven workflow failures
- Worked closely with technical and business counterparts on architecture, retrieval context, implementation, testing, and production behavior in a fast-moving startup environment
- Contributed to AI-assisted development workflows that improved speed without lowering validation, code quality, or security expectations

Technical Solutions Engineer | PayPal / Honey | 2020 to 2024

- Built remotely managed configuration for Amazon.com scraper behavior, allowing integration changes without deployment and reducing catalog downtime during outages from approximately one day to approximately two hours
- Built a Node.js integration serving approximately 27,000 WooCommerce merchant sites through a consolidated backend pipeline
- Built an Apache Airflow pipeline that analyzed a Jira board tracking approximately 40,000 ecommerce integrations
- Created the integrations health dashboard in Periscope Data, defining metrics and writing SQL used to monitor regressions and platform health
- Rotated on call for the production integrations platform, debugging failures across browser extension logic, scrapers, data pipelines, and other engineers' code
- Trained approximately 21 engineers on platform architecture, integration workflows, and development environment setup
- Worked with relational data, operational processes, and security-sensitive integration systems in a large production environment

EDUCATION

Udacity / Grow With Google | Mobile Web Specialist, 2018

Self-taught software engineer who transitioned from operations into production engineering.
